

AEQGA quantum circuits

$n_p = 32$ · Separate circuits for H_0 and Ω_M

(a) Random subset · 16 individuals / 4 qubits

(b) Elite-copy subset · 8 individuals / 3 qubits

Crossover: $CR_y^{0 \rightarrow 1}(\pi/2)$ then $CR_y^{1 \rightarrow 0}(\pi/2)$ · Mutation: $R_x^2(\pi/2)$

Example selected qubits; crossover and mutation are each applied with probability 0.5.
